# Consistency

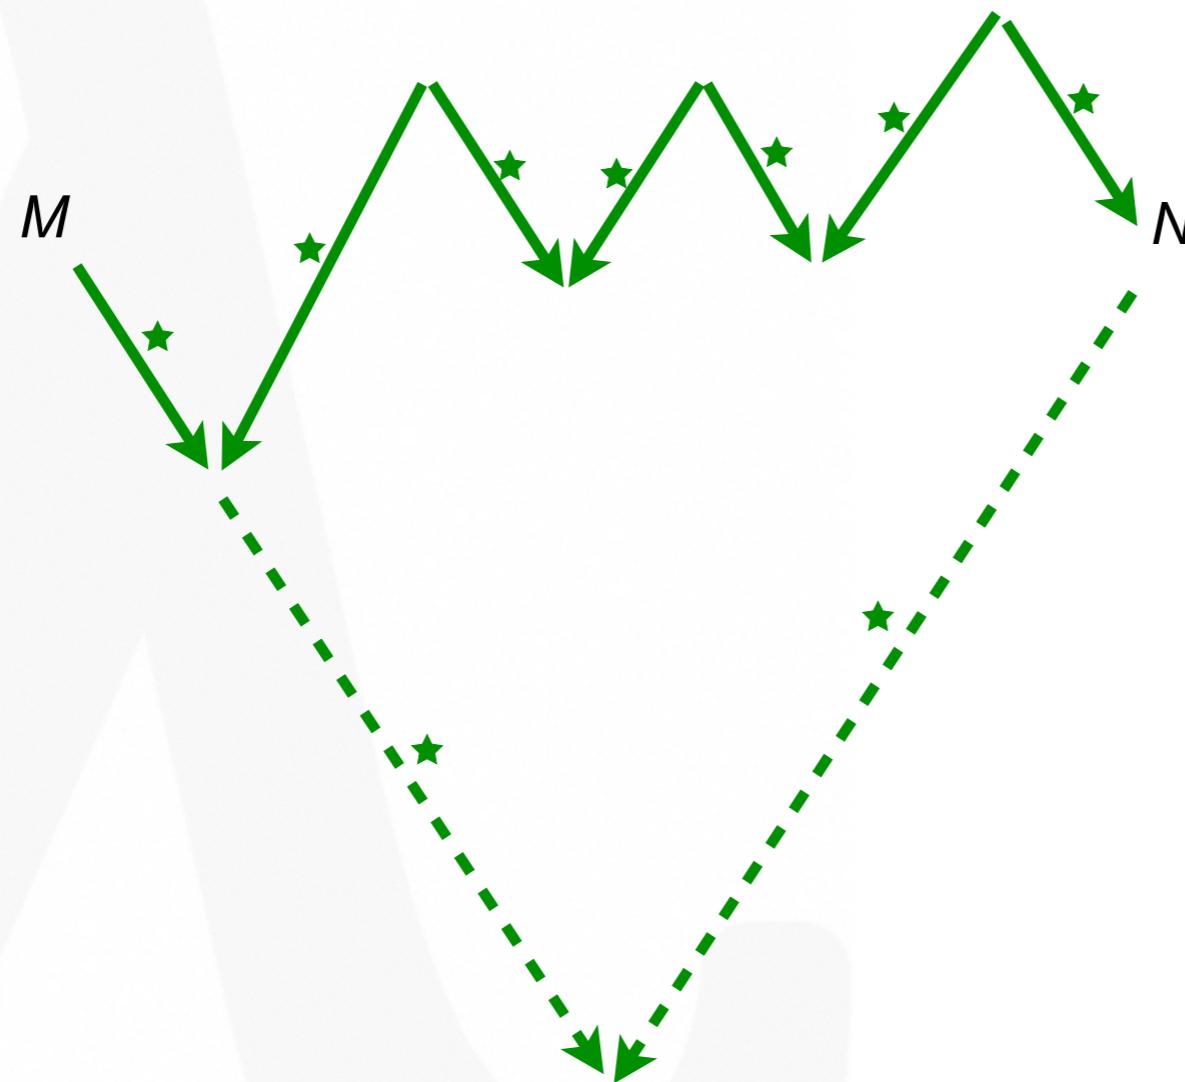

**Question:** Can we get  $M \xrightarrow{*} 2$  and  $M \xrightarrow{*} 3$  ??

Consequence:  $2 =_{\beta} 3$  !!

# Confluence

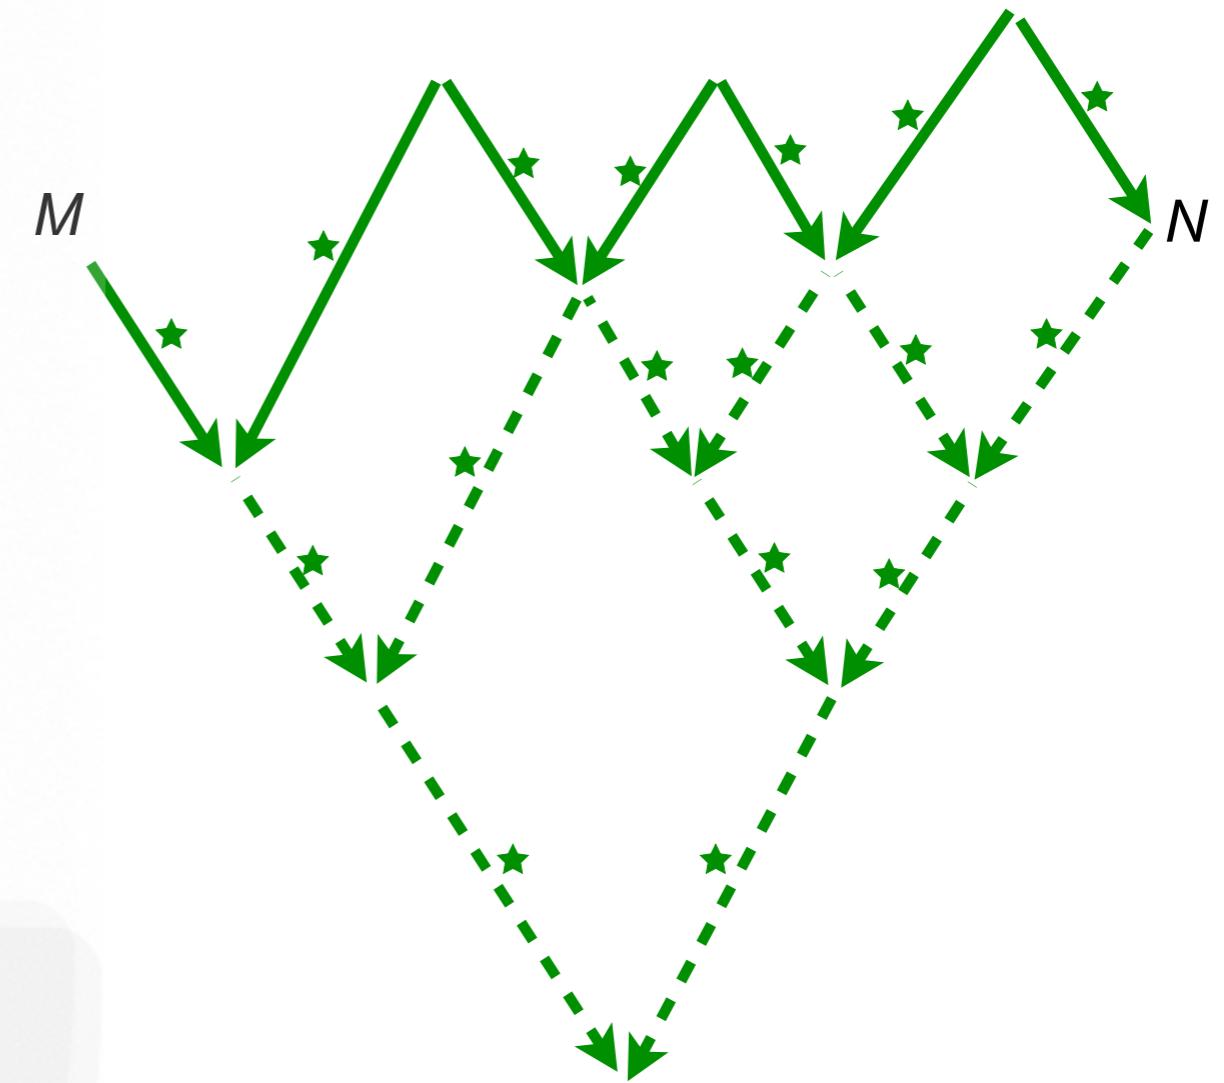

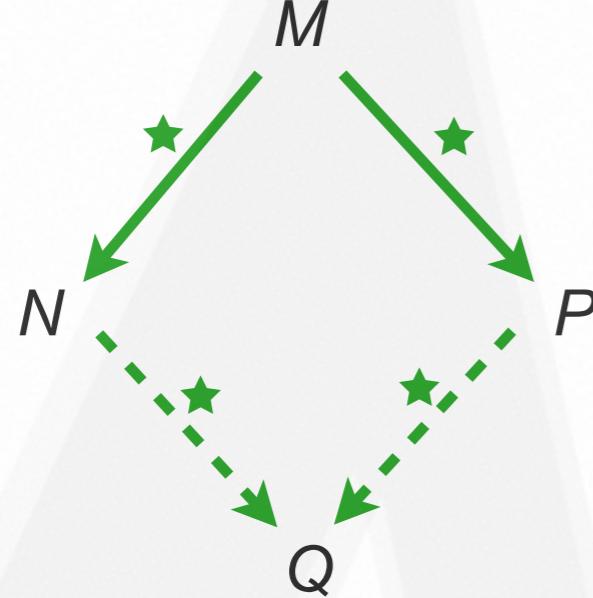

**Question:** If  $M =_{\beta} N$ , then  $M \xrightarrow{*} P$  and  $N \xrightarrow{*} P$  for some  $P$  ??

Then impossible to get  $2 =_{\beta} 3$

# Confluence

**Question:** If  $M \xrightarrow{*} N$  and  $M \xrightarrow{*} P$ , then  $N \xrightarrow{*} Q$  and  $P \xrightarrow{*} Q$  for some  $Q$  ?

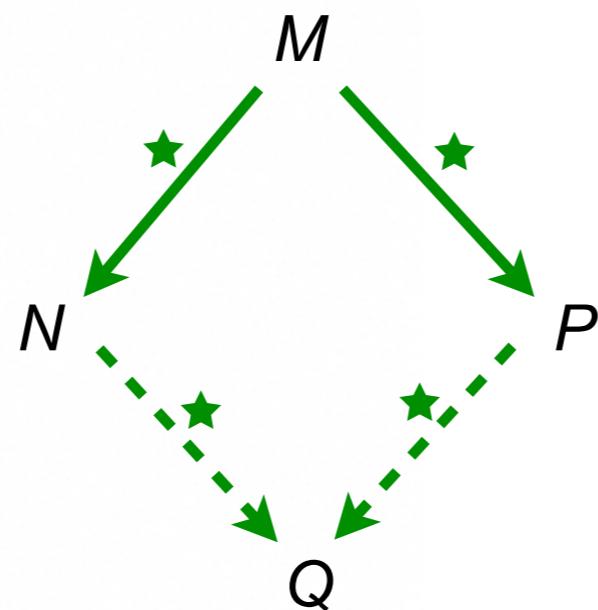

**Corollary:** [unicity of normal forms]

If  $M \xrightarrow{*} N$  in normal form and  $M \xrightarrow{*} N'$  in normal form, then  $N = N'$ .

# Confluence

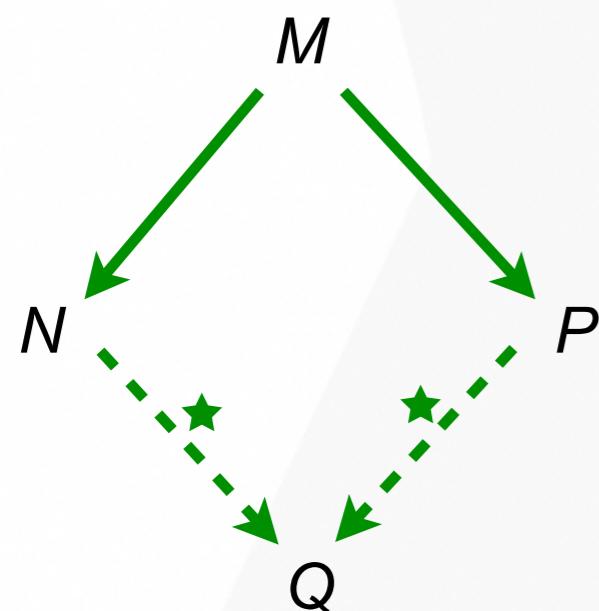

**Goal:** If  $M \xrightarrow{*} N$  and  $M \xrightarrow{*} P$ , there is  $Q$  such that  $N \xrightarrow{*} Q$  and  $P \xrightarrow{*} Q$

How to prove confluence ?

# Local confluence

- **Theorem 1:** If  $M \rightarrow N$  and  $M \rightarrow P$  there is  $Q$  such that  $N \xrightarrow{*} Q$  and  $P \xrightarrow{*} Q$

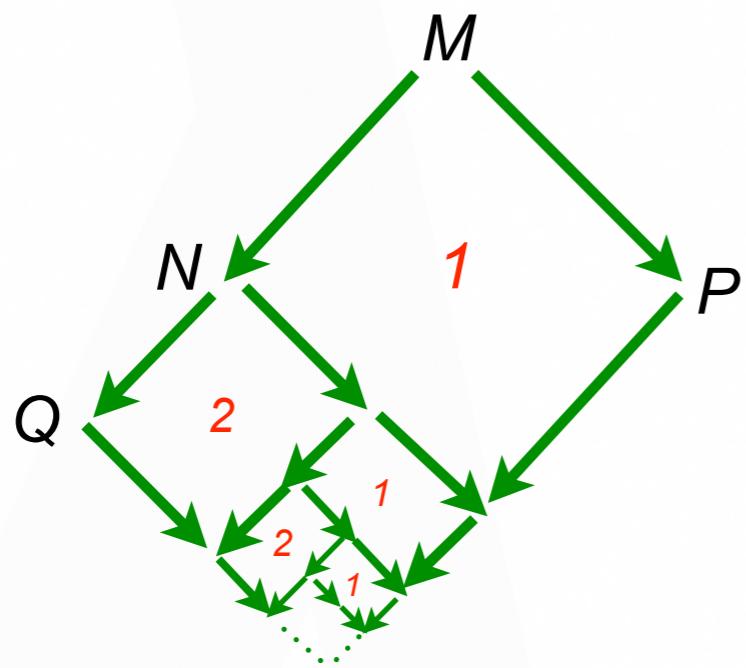

- Example:  $(\lambda x.xx)(Iz) \xrightarrow{} (\lambda x.xx)z$   
 $\qquad\qquad\qquad \xrightarrow{} Iz(Iz) \xrightarrow{*} zz$

where  $I = \lambda x.x$

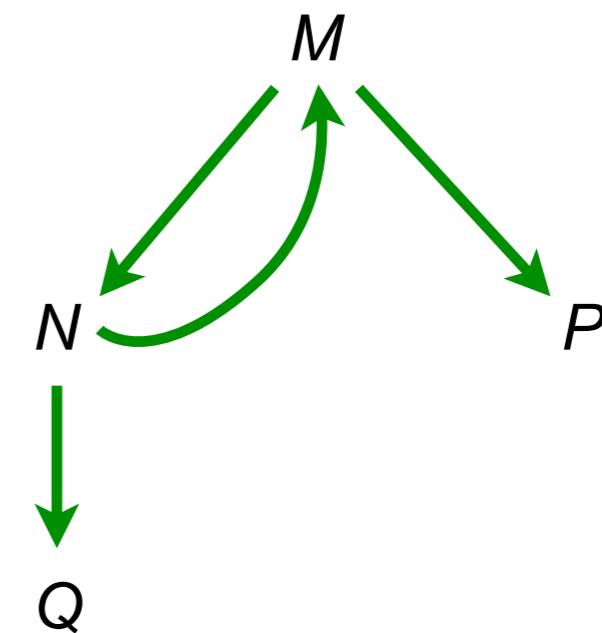

- **Lemma 1:**  $M \rightarrow N$  implies  $P\{x := M\} \xrightarrow{*} P\{x := N\}$
- **Lemma 2:**  $M \rightarrow N$  implies  $M\{x := P\} \rightarrow N\{x := P\}$
- **Substitution lemma:**  $M\{x := N\}\{y := P\} = M\{y := P\}\{x := N\{y := P\}\}$   
when  $x$  not free in  $P$

# Confluency

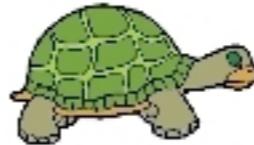

- **Fact:** local confluence does not imply confluence

**10 km/hr**

**1 km/hr**

# Confluence

We define  $\not\Rightarrow$  such that  $\rightarrow \subset \not\Rightarrow \subset \xrightarrow{*}$

- **Definition [parallel reduction]:**

[Var Axiom]  $x \not\Rightarrow x$

[Const Axiom]  $c \not\Rightarrow c$

$$[\text{App Rule}] \frac{M \not\Rightarrow M' \quad N \not\Rightarrow N'}{MN \not\Rightarrow M'N'}$$

$$[\text{Abs Rule}] \frac{M \not\Rightarrow M'}{\lambda x.M \not\Rightarrow \lambda x.M'}$$

$$[\text{//Beta Rule}] \frac{M \not\Rightarrow M' \quad N \not\Rightarrow N'}{(\lambda x.M)N \not\Rightarrow M'\{x := N'\}}$$

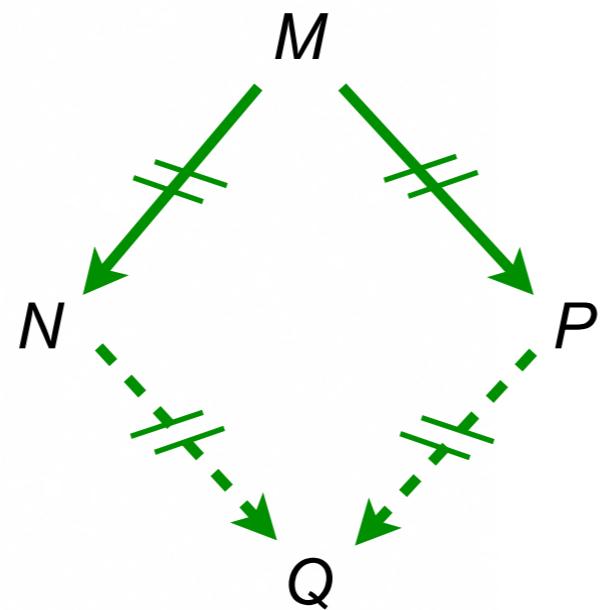

- Example:

$$\begin{array}{c} x \not\Rightarrow x \quad z \not\Rightarrow z \quad x \not\Rightarrow x \quad z \not\Rightarrow z \\ \hline Ix \not\Rightarrow z \\ \hline \hline Ix(Iz) \not\Rightarrow zz \end{array}$$

$$I = \lambda x.x$$

# Confluence

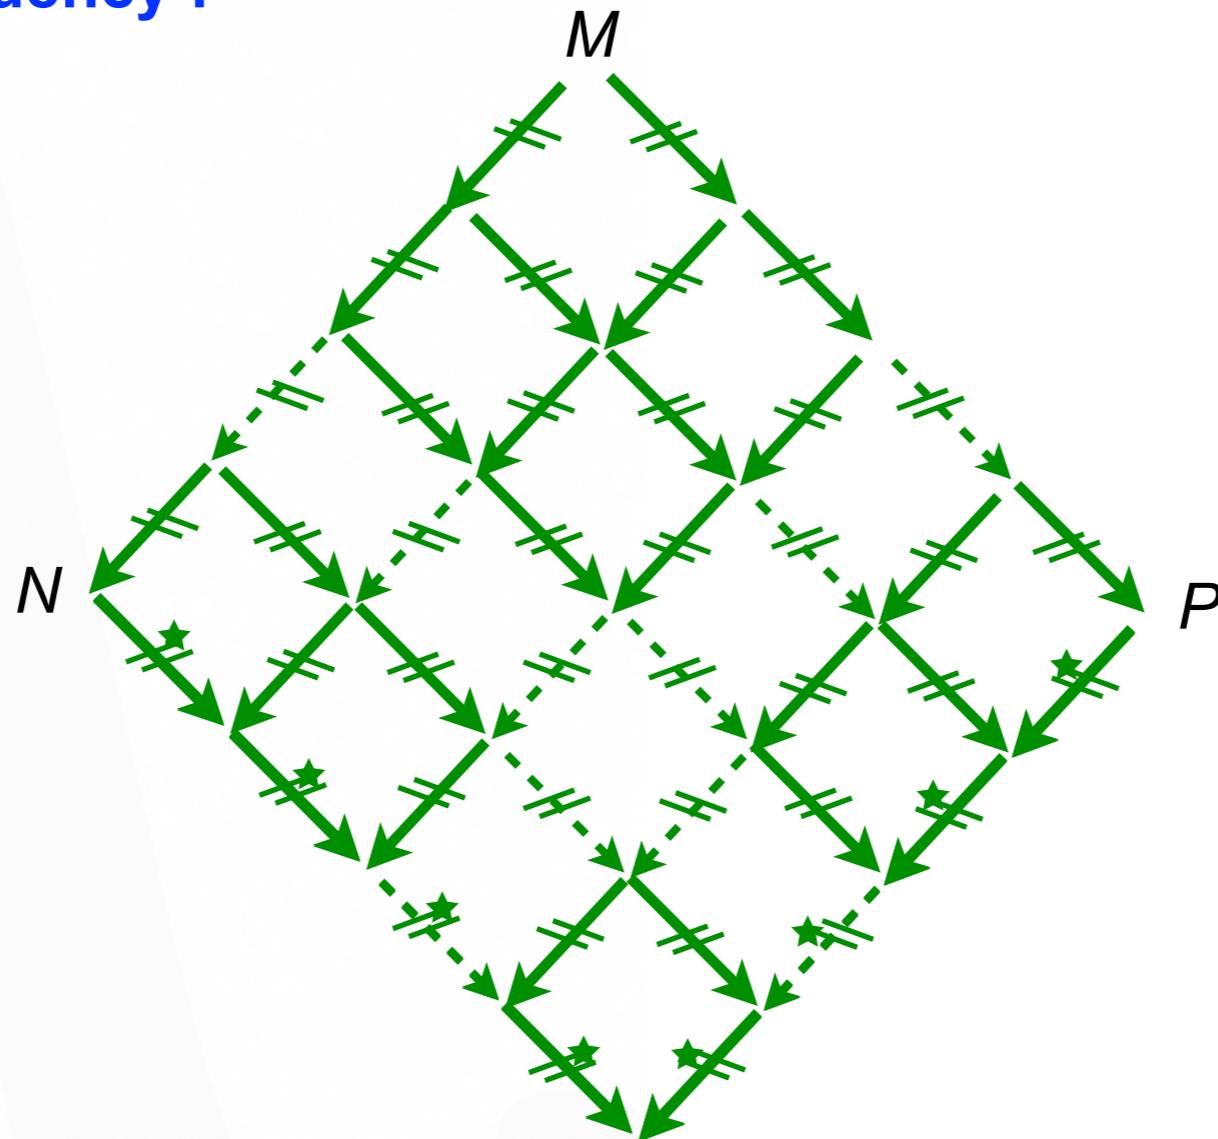

- Goal is to prove **strongly local confluence**:

- Example:  $(\lambda x. xx)(Iz) \xrightarrow{\neq} (\lambda x. xx)z \xrightarrow{\neq} Iz(Iz) \xrightarrow{\neq} zz$

# Confluency

- Proof of confluence :

# Confluence

- **Lemma 4:**  $M \not\Rightarrow N$  and  $P \not\Rightarrow Q$  implies  $M\{x := P\} \not\Rightarrow N\{x := Q\}$

**Proof:** by structural induction on  $M$ .

Case 1:  $M = x \not\Rightarrow x = N$ . Then  $M\{x := P\} = P \not\Rightarrow Q = N\{x := Q\}$

Case 2:  $M = y \not\Rightarrow y = N$ . Then  $M\{x := P\} = y \not\Rightarrow y = N\{x := Q\}$

Case 3:  $M = \lambda y. M_1 \not\Rightarrow \lambda y. N_1 = N$  with  $M_1 \not\Rightarrow N_1$ . By induction  $M_1\{x := P\} \not\Rightarrow N_1\{x := Q\}$ . So  $M\{x := P\} = \lambda y. M_1\{x := P\} \not\Rightarrow \lambda y. N_1\{x := Q\} = N$ .

Case 4:  $M = M_1 M_2 \not\Rightarrow N_1 N_2 = N$  with  $M_1 \not\Rightarrow N_1$  and  $M_2 \not\Rightarrow N_2$ . By induction  $M_1\{x := P\} \not\Rightarrow N_1\{x := Q\}$  and  $M_2\{x := P\} \not\Rightarrow N_2\{x := Q\}$ . So  $M\{x := P\} = M_1\{x := P\} M_2\{x := P\} \not\Rightarrow N_1\{x := Q\} N_2\{x := Q\} = N\{x := Q\}$ .

Case 5:  $M = (\lambda y. M_1) M_2 \not\Rightarrow N_1\{y := N_2\} = N$  with  $M_1 \not\Rightarrow N_1$  and  $M_2 \not\Rightarrow N_2$ . By induction  $M_1\{x := P\} \not\Rightarrow N_1\{x := Q\}$  and  $M_2\{x := P\} \not\Rightarrow N_2\{x := Q\}$ . So  $M\{x := P\} = (\lambda y. M_1\{x := P\})(M_2\{x := P\}) \not\Rightarrow N_1\{x := Q\}\{y := N_2\{x := Q\}\} = N_1\{y := N_2\}\{x := Q\} = N$  by **substitution lemma**, since  $y \notin \text{var}(Q) \subset \text{var}(P)$ .  $\square$

# Confluence

- **Lemma 5:** If  $M \not\Rightarrow N$  and  $M \not\Rightarrow P$ , then  $N \not\Rightarrow Q$  and  $P \not\Rightarrow Q$  for some  $Q$ .

**Proof:** by structural induction on  $M$ .

Case 1:  $M = x$ . Then  $M = x \not\Rightarrow x = N$  and  $M = x \not\Rightarrow x = P$ . We have too  $N \not\Rightarrow x = Q$  and  $P \not\Rightarrow x = Q$ .

Case 2:  $M = \lambda y.M_1 \not\Rightarrow \lambda y.N_1 = N$  with  $M_1 \not\Rightarrow N_1$ . Same for  $M = \lambda y.M_1 \not\Rightarrow \lambda y.P_1 = P$  with  $M_1 \not\Rightarrow P_1$ . By induction  $N_1 \not\Rightarrow Q_1$  and  $P_1 \not\Rightarrow Q_1$  for some  $Q_1$ . So  $N = \lambda y.N_1 \not\Rightarrow \lambda y.Q_1 = Q$  and  $P = \lambda y.P_1 \not\Rightarrow \lambda y.Q_1 = Q$ .

Case 3:  $M = M_1 M_2 \not\Rightarrow N_1 N_2 = N$  and  $M = M_1 M_2 \not\Rightarrow P_1 P_2 = P$  with  $M_i \not\Rightarrow N_i$ ,  $M_i \not\Rightarrow P_i$  ( $1 \leq i \leq 2$ ). By induction  $N_i \not\Rightarrow Q_i$  and  $P_i \not\Rightarrow Q_i$  for some  $Q_i$ . So  $N \not\Rightarrow Q_1 Q_2 = Q$  and  $P \not\Rightarrow Q_1 Q_2 = Q$ .

Case 4:  $M = (\lambda x.M_1)M_2 \not\Rightarrow N_1\{x := N_2\} = N$  and  $M = (\lambda x.M_1)M_2 \not\Rightarrow P'P_2 = P$  with  $M_i \not\Rightarrow N_i$  ( $1 \leq i \leq 2$ ) and  $\lambda x.M_1 \not\Rightarrow P'$ ,  $M_2 \not\Rightarrow P_2$ . Therefore  $P' = \lambda x.P_1$  with  $M_1 \not\Rightarrow P_1$ . By induction  $N_i \not\Rightarrow Q_i$  and  $P_i \not\Rightarrow Q_i$  for some  $Q_i$ .  
So  $N \not\Rightarrow Q_1\{x := Q_2\} = Q$  by **lemma 4**. And  $P \not\Rightarrow Q_1\{x := Q_2\} = Q$  by definition.

Case 5: symmetric.

# Confluence

**Proof:** ....

Case 6:  $M = (\lambda x.M_1)M_2 \not\Rightarrow N_1\{x := N_2\} = N$  and  $M = (\lambda x.M_1)M_2 \not\Rightarrow P_1\{x := P_2\} = P$  with  $M_i \not\Rightarrow N_i, M_i \not\Rightarrow P_i$  ( $1 \leq i \leq 2$ ). By induction  $N_i \not\Rightarrow Q_i$  and  $P_i \not\Rightarrow Q_i$  for some  $Q_i$ .

So  $N \not\Rightarrow Q_1\{x := Q_2\} = Q$  and  $P \not\Rightarrow Q_1\{x := Q_2\} = Q$  by **lemma 4**.  $\square$

- **Lemma 6:** If  $M \rightarrow N$ , then  $M \not\Rightarrow N$ .
- **Lemma 7:** If  $M \not\Rightarrow N$ , then  $M \xrightarrow{*} N$ .

**Proofs:** obvious.

- **Theorem 2 [Church-Rosser]:**  
If  $M \xrightarrow{*} N$  and  $M \xrightarrow{*} P$ , then  $N \xrightarrow{*} Q$  and  $P \xrightarrow{*} Q$  for some  $Q$ .

# Confluence

# Residuals of redexes

- tracking redexes while contracting others
- examples:

$$\Delta(\underline{Ia}) \rightarrow \underline{Ia}(\underline{Ia})$$

$$\Delta = \lambda x. xx \quad I = \lambda x. x \quad K = \lambda xy. x$$

$$\underline{Ia}(\Delta(\underline{Ib})) \rightarrow \underline{Ia}(\underline{Ib}(\underline{Ib}))$$

$$\underline{I}(\Delta(\underline{Ia})) \rightarrow \underline{I}(\underline{Ia}(\underline{Ia}))$$

$$\underline{\Delta(Ia)} \rightarrow \underline{Ia}(Ia))$$

$$Ia(\Delta(\underline{Ib})) \rightarrow Ia(\underline{Ib}(\underline{Ib}))$$

$$\underline{\Delta\Delta} \rightarrow \Delta\Delta$$

$$(\lambda x. Ia)(\underline{Ib}) \rightarrow Ia$$

# Residuals of redexes

- when  $R$  is redex in  $M$  and  $M \xrightarrow{S} N$

the set  $R/S$  of **residuals** of  $R$  in  $N$  is defined by inspecting relative positions of  $R$  and  $S$  in  $M$ :

**1-**  $R$  and  $S$  disjoint,  $M = \dots \underline{R} \dots S \dots \xrightarrow{S} \dots \underline{R} \dots S' \dots = N$

**2-**  $S$  in  $R = (\lambda x.A)B$

**2a-**  $S$  in  $A$ ,  $M = \dots (\underline{\lambda x. \dots S \dots}) B \dots \xrightarrow{S} \dots (\underline{\lambda x. \dots S'} \dots) B \dots = N$

**2b-**  $S$  in  $B$ ,  $M = \dots (\underline{\lambda x.A})(\dots S \dots) \dots \xrightarrow{S} \dots (\underline{\lambda x.A})(\dots S' \dots) \dots = N$

**3-**  $R$  in  $S = (\lambda y.C)D$

**3a-**  $R$  in  $C$ ,  $M = \dots (\lambda y. \dots \underline{R} \dots) D \dots \xrightarrow{S} \dots \dots \dots \underline{R\{y := D\}} \dots \dots \dots = N$

**3b-**  $R$  in  $D$ ,  $M = \dots (\lambda y.C)(\dots \underline{R} \dots) \dots \xrightarrow{S} \dots (\dots \underline{R} \dots) \dots (\dots \underline{R} \dots) \dots = N$

**4-**  $R$  is  $S$ , no residuals of  $R$ .

# Residuals of redexes

- when  $\rho$  is a reduction from  $M$  to  $N$ , i.e.  $\rho : M \xrightarrow{*} N$   
the set of residuals of  $R$  by  $\rho$  is defined by **transitivity** on the length of  $\rho$   
and is written  $R/\rho$
- notice that we can have  $S \in R/\rho$  and  $R \neq S$   
residuals may **not** be syntactically **equal** (see previous 3rd example)
- residuals **depend on reductions**. Two reductions between same terms may produce two distinct sets of residuals.
- a redex is residual of a **single** redex (the inverse of the residual relation is a function):  $R \in S/\rho$  and  $R \in T/\rho$  implies  $S = T$

# Exercises

- Find redex  $R$  and reductions  $\rho$  and  $\sigma$  between  $M$  and  $N$  such that residuals of  $R$  by  $\rho$  and  $\sigma$  differ. Hint: consider  $M = I(Ix)$
- Show that residuals of nested redexes keep nested.
- Show that residuals of disjoint redexes may be nested.
- Show that residuals of a redex may be nested after several reduction steps.

# Created redexes

- A redex is **created by reduction**  $\rho$  if it is not a residual by  $\rho$  of a redex in initial term. Thus  $R$  is created by  $\rho$  when  $\rho : M \xrightarrow{*} N$  and  $\nexists S, R \in S/\rho$

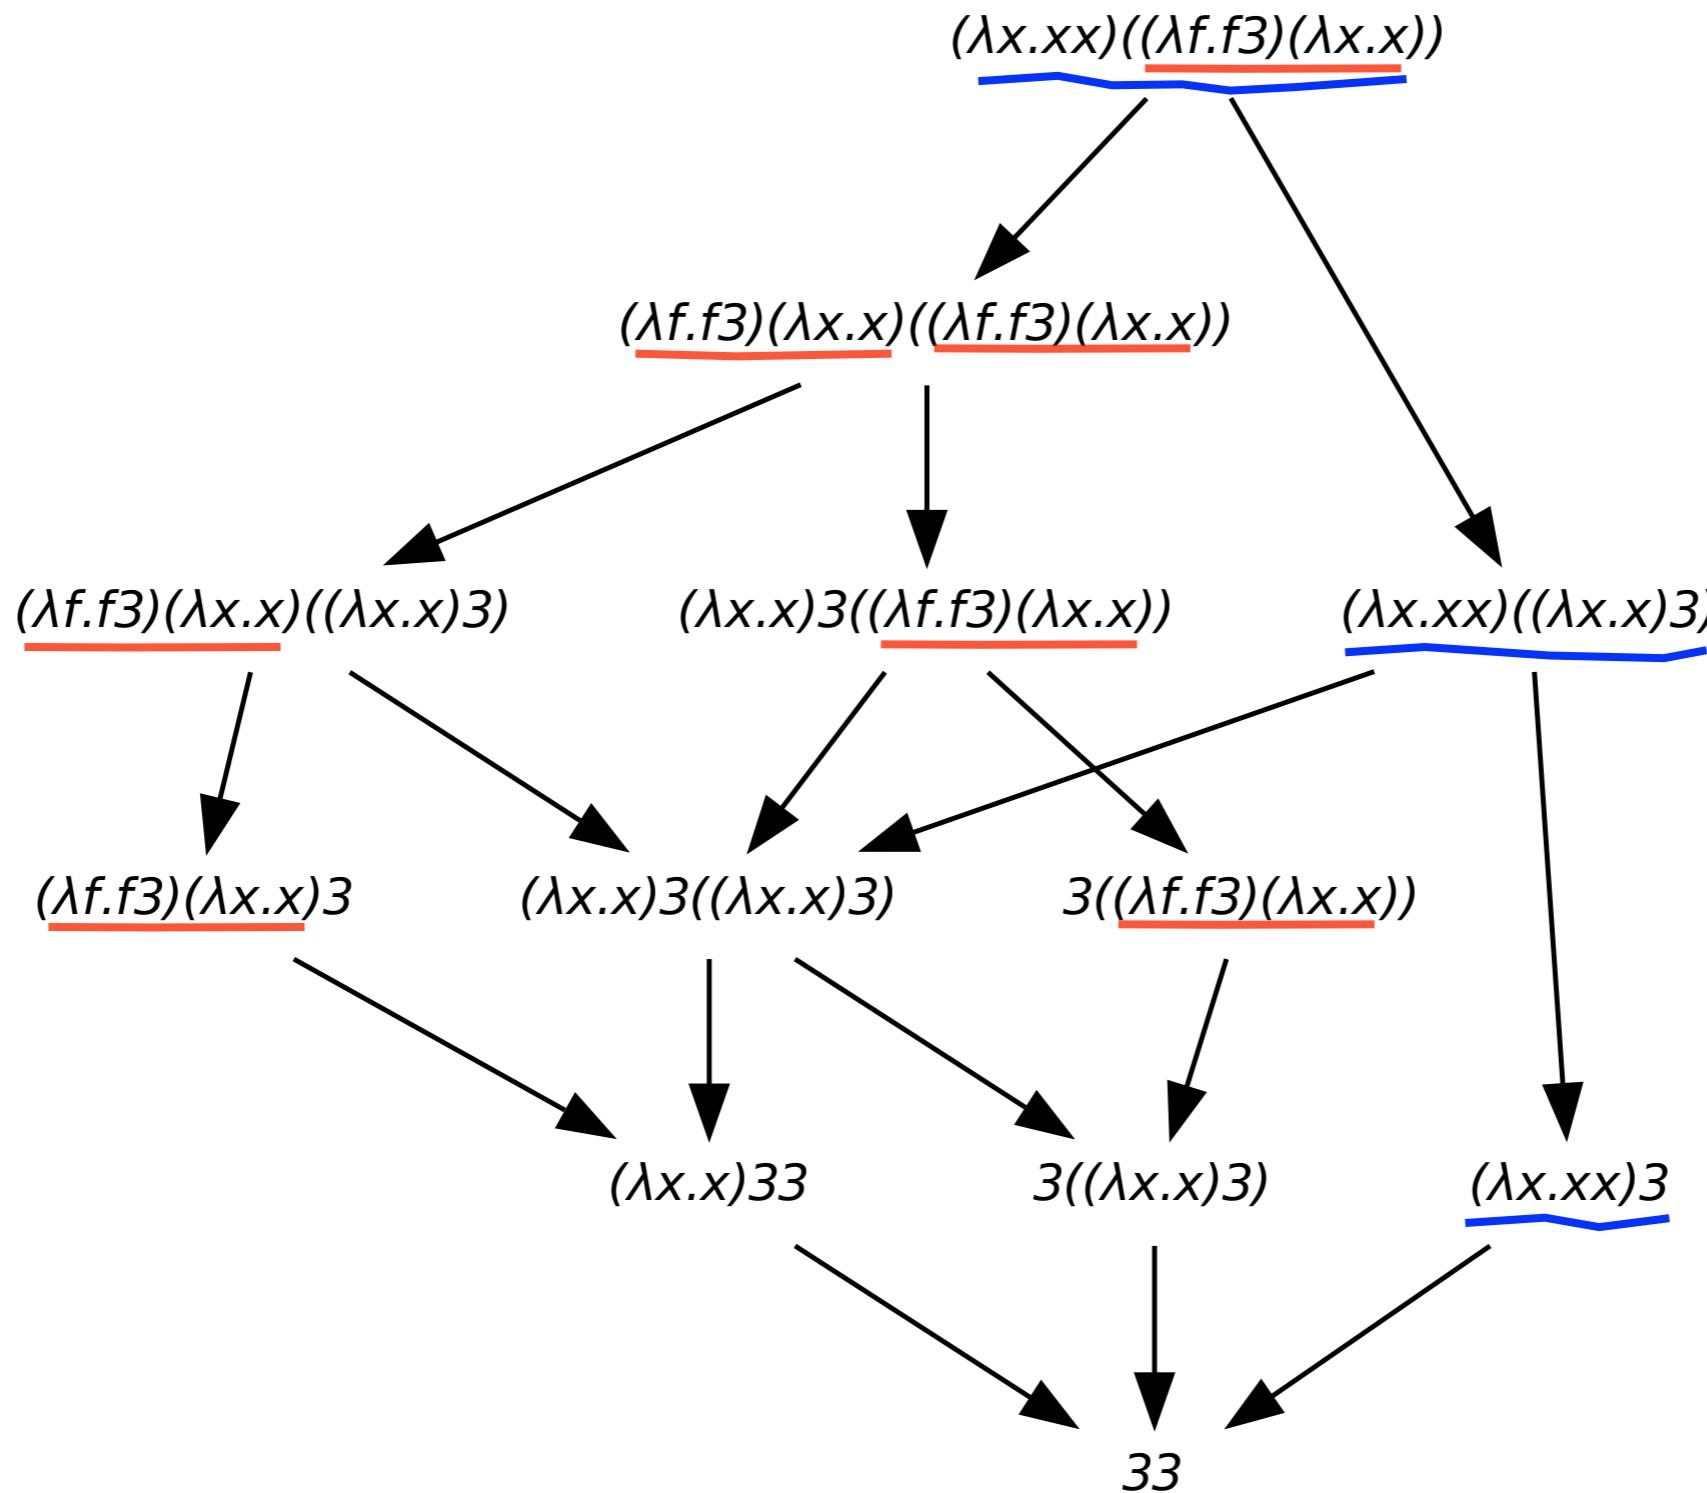

$$(\lambda x.xa)I \xrightarrow{*} \underline{Ia}$$

$$(\lambda xy.xy)ab \xrightarrow{*} (\lambda y.ay)b$$

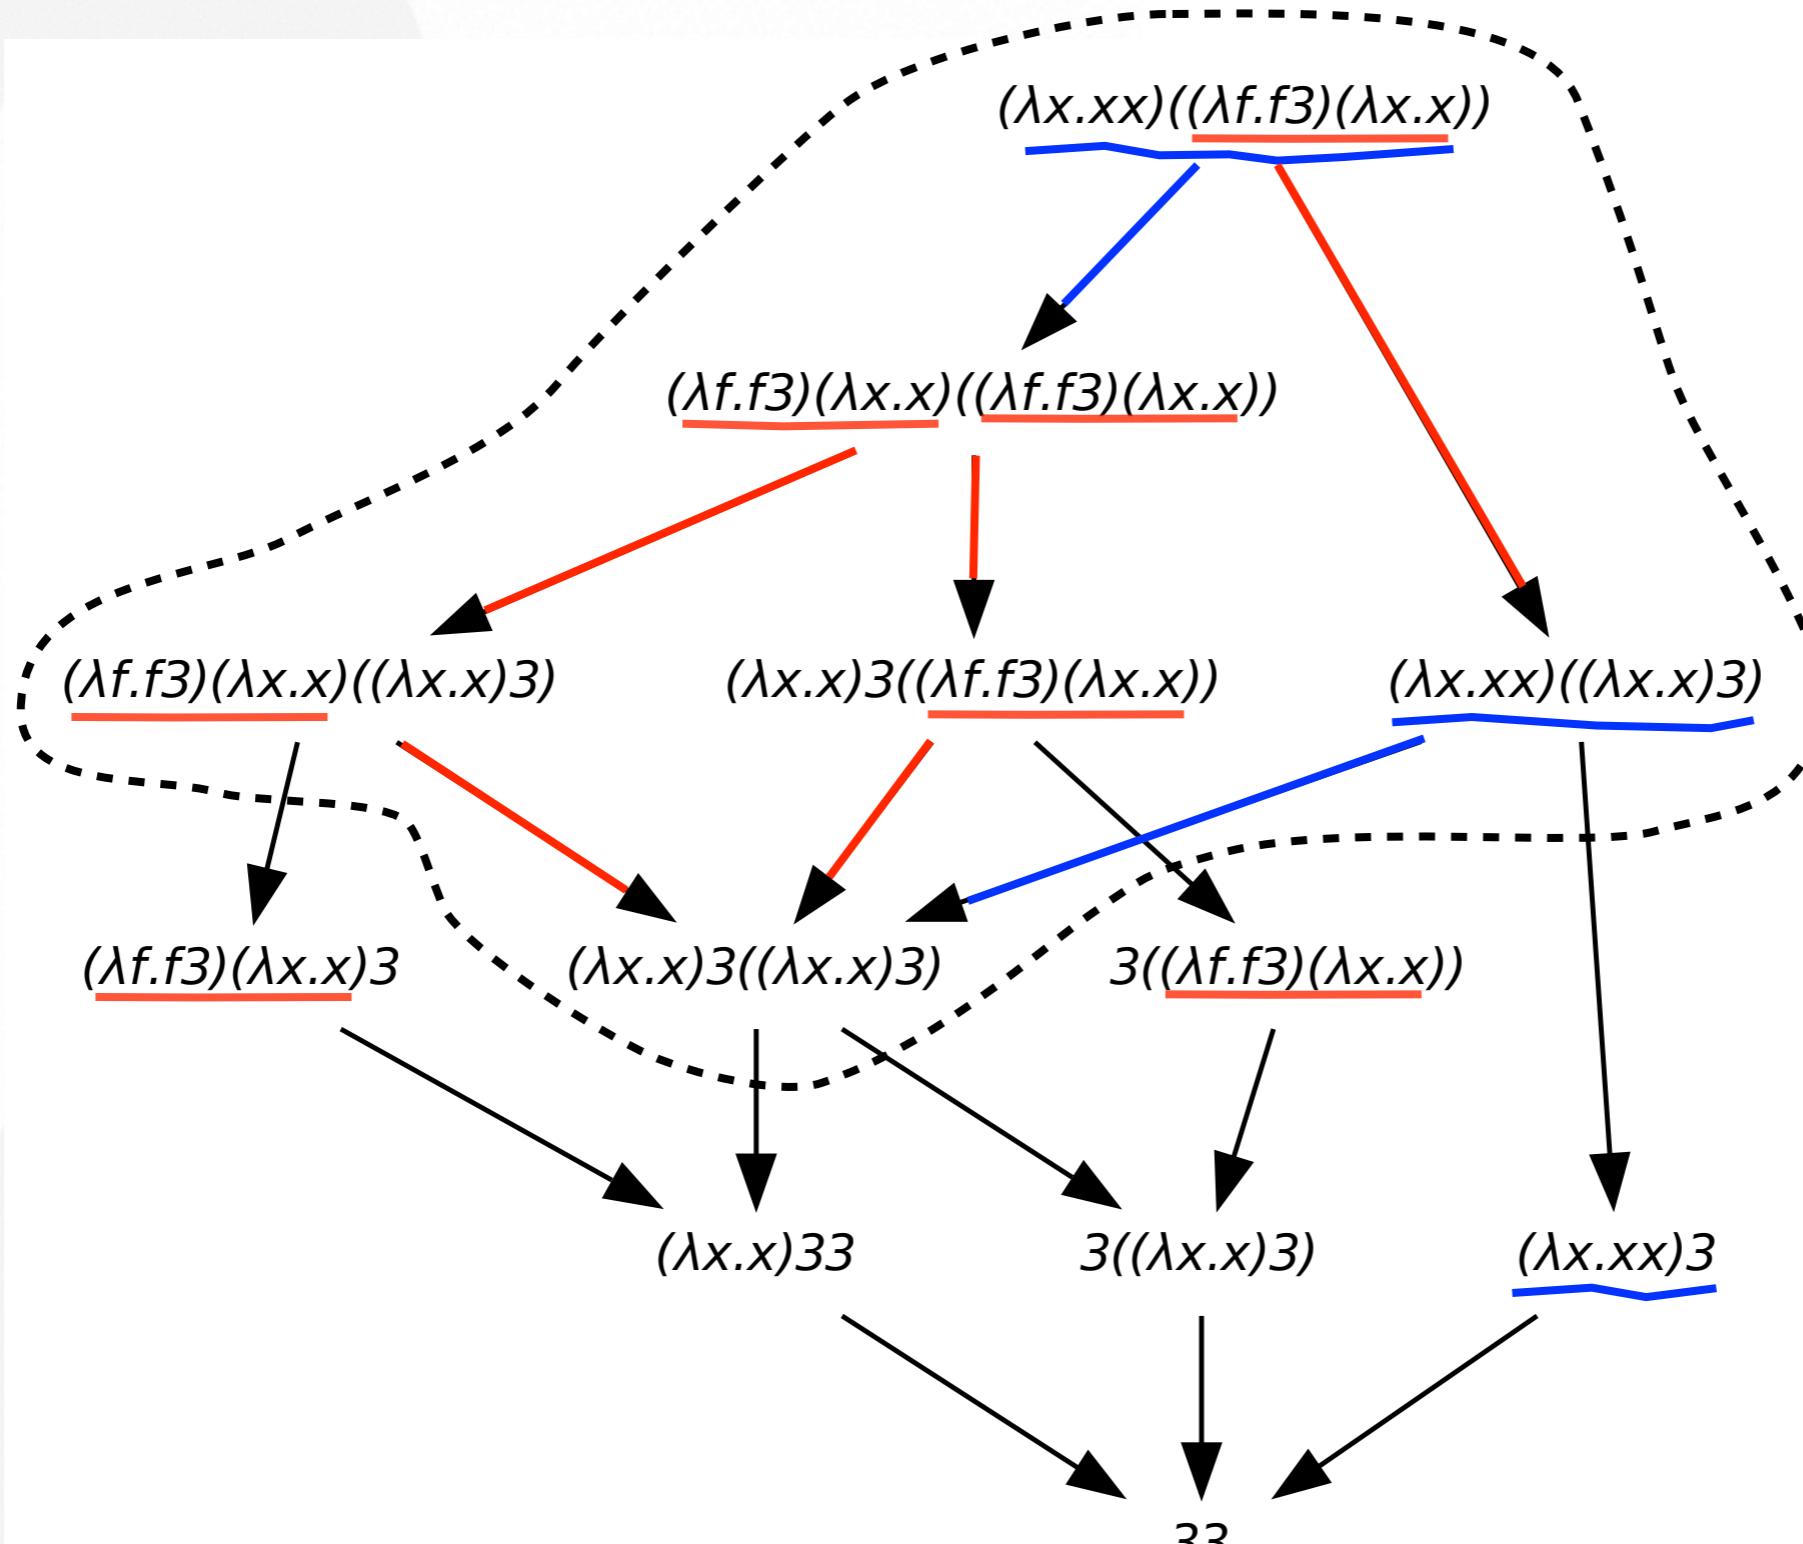

$$IIa \xrightarrow{*} \underline{Ia}$$

$$\Delta\Delta \xrightarrow{*} \underline{\Delta\Delta}$$

# Residuals of redexes

# Relative reductions

# Finite developments

- Let  $\mathcal{F}$  be a set of redexes in  $M$ . A reduction **relative to  $\mathcal{F}$**  only contracts residuals of  $\mathcal{F}$ .
- When there are no more residuals of  $\mathcal{F}$  to contract, we say the relative reduction is a **development of  $\mathcal{F}$** .
- **Theorem 3 [finite developments] (Curry)** Let  $\mathcal{F}$  be a set of redexes in  $M$ . Then:
  - relative reductions **cannot be infinite**; they all end in a development of  $\mathcal{F}$
  - all developments end on a **same** term  $N$
  - let  $R$  be a redex in  $M$ . Then **residuals** of  $R$  by finite developments of  $\mathcal{F}$  are the same.

# Finite developments

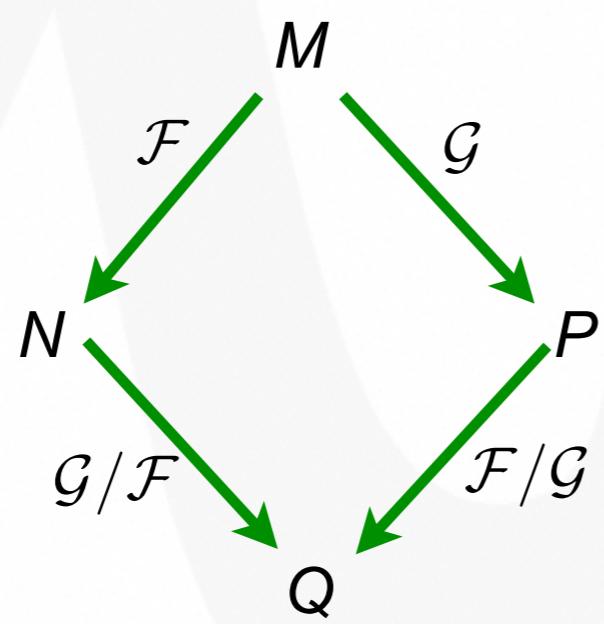

- Therefore we can define (without ambiguity) a new **parallel step** reduction:

$$\rho : M \xrightarrow{\mathcal{F}} N$$

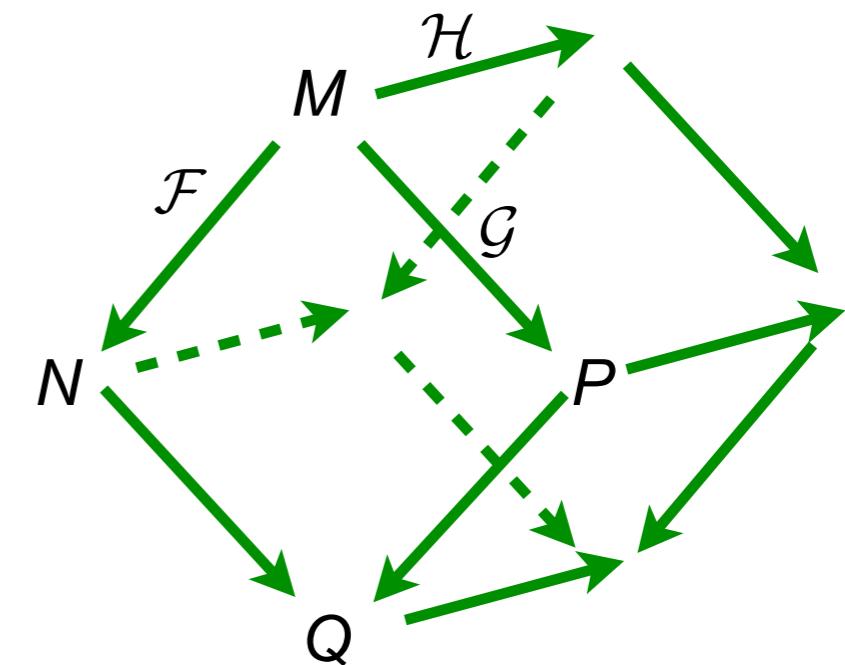

and when  $R$  is a redex in  $M$ , we can write  $R/\mathcal{F}$  for its residuals in  $N$

- **Two corollaries:**

Lemma of **Parallel Moves**

**Cube** Lemma

# Labeled calculus

- Finite developments will be shown with a labeled calculus.
- **Lambda calculus with labeled redexes**

$M, N, P$	$::=$	$x, y, z, \dots$	(variables)
		$(\lambda x.M)$	( $M$ as function of $x$ )
		$(M\ N)$	( $M$ applied to $N$ )
		$c, d, \dots$	(constants )
		$(\lambda x.M)^r\ N$	(labeled redexes)

- **$\mathcal{F}$ -labeled reduction**

$$(\lambda x.M)^r\ N \xrightarrow{\quad} M\{x := N\} \quad \text{when } r \in \mathcal{F}$$

- **Labeled substitution**

... as before

$$((\lambda x.M)^r\ N)\{y := P\} = ((\lambda x.M)\{y := P\})^r(N\{y := P\})$$

# Labeled calculus

- **Theorem** For any  $\mathcal{F}$ , the labeled calculus is **confluent**.
- **Theorem** For any  $\mathcal{F}$ , the labeled calculus is **strongly normalizable** (no infinite labeled reductions).
- **Lemma** For any  $\mathcal{F}$ -reduction  $\rho : M \xrightarrow{*} N$ , a labeled redex in  $N$  has label  $r$  if and only if it is **residual** by  $\rho$  of a redex with label  $r$  in  $M$ .

- **Theorem 3 [finite developments] (Curry)**

# Labeled calculus

- Proof of confluence is again with Martin-Löf's axiomatic method.
- Proof of residual property is by simple inspection of a reduction step.
- Proof of termination is slightly more complex with following lemmas:
  - **Notation**  $M \xrightarrow[\text{int}]{\star} N$  if  $M$  reduces to  $N$  without contracting a toplevel redex.
  - **Lemma 1 [Barendregt-like]**  $M\{x := N\} \xrightarrow[\text{int}]{\star} (\lambda y.P)^r Q$  implies  
 $M = (\lambda y.A)^r B$  with  $A\{x := N\} \xrightarrow{\star} P$ ,  $B\{x := N\} \xrightarrow{\star} Q$   
or  
 $M = x$  and  $N \xrightarrow{\star} (\lambda y.P)^r Q$
  - **Lemma 2**  $M, N \in \mathcal{SN}$  (strongly normalizing) implies  $M\{x := N\} \in \mathcal{SN}$
  - **Theorem**  $M \in \mathcal{SN}$  for all  $M$ .

# Labeled calculus proofs

- **Lemma 1 [Barendregt-like]**  $M\{x := N\} \xrightarrow[\text{int}]{} (\lambda y.P)^r Q$  implies  
 $M = (\lambda y.A)^r B$  with  $A\{x := N\} \xrightarrow{} P$ ,  $B\{x := N\} \xrightarrow{} Q$   
or  
 $M = x$  and  $N \xrightarrow{} (\lambda y.P)^r Q$

**Proof** Let  $P^*$  be  $P\{x := N\}$  for any  $P$ .

Case 1:  $M = x$ . Then  $M^* = N$  and  $N \xrightarrow{} (\lambda y.P)^r Q$ .

Case 2:  $M = y$ . Then  $M^* = y$ . Impossible.

Case 2:  $M = \lambda y.M_1$ . Again impossible.

Case 3:  $M = M_1 M_2$  or  $M = (\lambda y.M_1)^s M_2$  with  $s \neq r$ . These cases are also impossible.

Case 4:  $M = (\lambda y.M_1)^r M_2$ . Then  $M_1^* \xrightarrow{} P$  and  $M_2^* \xrightarrow{} Q$ .

# Labeled calculus proofs

- **Lemma 2**  $M, N \in \mathcal{SN}$  (strongly normalizing) implies  $M\{x := N\} \in \mathcal{SN}$

**Proof:** by induction on  $\langle \text{depth}(M), ||M|| \rangle$ . Let  $P^*$  be  $P\{x := N\}$  for any  $P$ .

Case 1:  $M = x$ . Then  $M^* = N \in \mathcal{SN}$ . If  $M = y$ . Then  $M^* = y \in \mathcal{SN}$ .

Case 2:  $M = \lambda y.M_1$ . Then  $M^* = \lambda y.M_1^*$  and by induction  $M_1^* \in \mathcal{SN}$ .

Case 3:  $M = M_1 M_2$  and never  $M^* \xrightarrow{\star} (\lambda y.A)^r B$ . Same argument on  $M_1$  and  $M_2$ .

Case 4:  $M = M_1 M_2$  and  $M^* \xrightarrow{\star} (\lambda y.A)^r B$ . We can always consider first time when this toplevel redex appears. Hence we have  $M^* \xrightarrow[\text{int}]{\star} (\lambda y.A)^r B$ . By lemma 1, we have two cases:

Case 4.1:  $M = (\lambda y.M_3)^r M_2$  with  $M_3^* \xrightarrow{\star} A$  and  $M_2^* \xrightarrow{\star} B$ . Then  $M^* = (\lambda y.M_3^*)^r M_2^*$ . As  $M_3 \in \mathcal{SN}$  and  $M_2 \in \mathcal{SN}$ , the internal reductions from  $M^*$  terminate by induction. If  $r \notin \mathcal{F}$ , there are no extra reductions. If  $r \in \mathcal{F}$ , we can have  $M_3^* \xrightarrow{\star} A$ ,  $M_2^* \xrightarrow{\star} B$  and  $(\lambda y.A)^r B \rightarrow A\{y := B\}$ . But  $M \rightarrow M_3\{y := M_2\}$  and  $(M_3\{y := M_2\})^* \xrightarrow{\star} A\{y := B\}$ . As  $\text{depth}(A\{y := B\}) \leq \text{depth}(M_3\{y := M_2\}) < \text{depth}(M)$ , we get  $A\{y := B\} \in \mathcal{SN}$  by induction.

Case 4.2:  $M = x$ . Impossible.

# Labeled calculus proofs

- **Theorem**  $M \in \mathcal{SN}$  for all  $M$ .

**Proof:** by induction on  $\|M\|$ .

Case 1:  $M = x$ . Obvious.

Case 2:  $M = \lambda x.M_1$ . Obvious since  $M_1 \in \mathcal{SN}$  by induction.

Case 3:  $M = M_1 M_2$  and  $M_1 \neq (\lambda x.A)^r$ . Then all reductions are internal to  $M_1$  and  $M_2$ . Therefore  $M \in \mathcal{SN}$  by induction on  $M_1$  and  $M_2$ .

Case 4:  $M = (\lambda x.M_1)^r M_2$  and  $r \notin \mathcal{F}$ . Same argument on  $M_1$  and  $M_2$ .

Case 5:  $M = (\lambda x.M_1)^r M_2$  and  $r \in \mathcal{F}$ . Then  $M_1$  and  $M_2$  in  $\mathcal{SN}$  by induction. But we can also have  $M \xrightarrow{*} (\lambda x.A)^r B \rightarrow A\{x := B\}$  with  $A$  and  $B$  in  $\mathcal{SN}$ . By Lemma 2, we know that  $A\{x := B\} \in \mathcal{SN}$ .

# Standardization

CENTRE DE RECHERCHE  
COMMUN

INRIA  
MICROSOFT RESEARCH

# Standard reduction

Redex  $R$  is **to the left of** redex  $S$  if the  $\lambda$  of  $R$  is to the left of the  $\lambda$  of  $S$ .

$$M = \dots (\underbrace{\lambda x. A}_R) B \dots (\underbrace{\lambda y. C}_S) D \dots$$

or

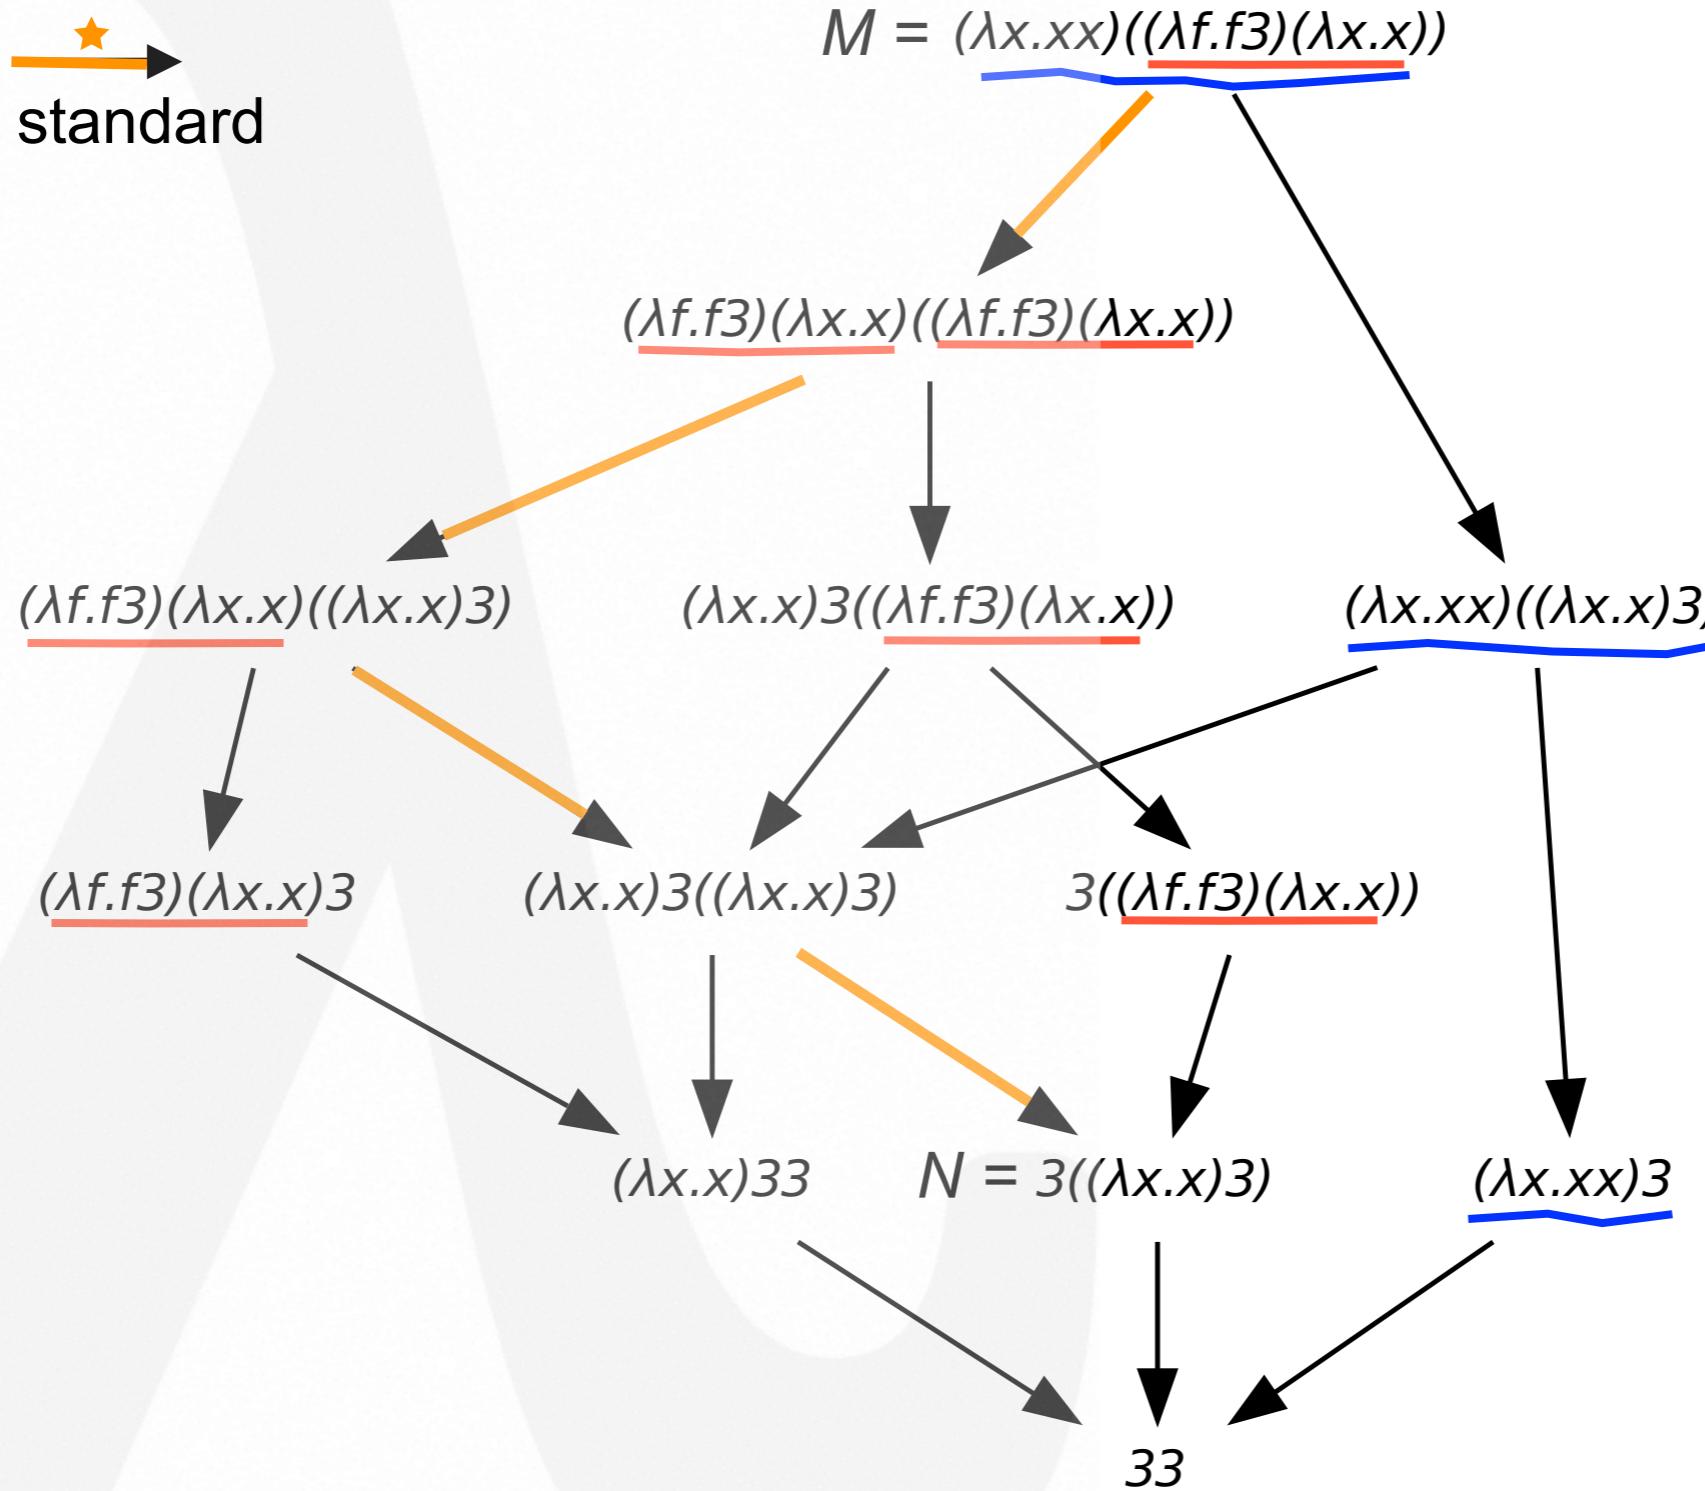

$$M = \dots (\lambda x. \dots (\underbrace{\lambda y. C}_S) D \dots) B \dots$$

or

$$M = \dots (\lambda x. A) (\dots (\underbrace{\lambda y. C}_S) D \dots) \dots$$

The reduction  $M = M_0 \xrightarrow{R_1} M_1 \xrightarrow{R_2} M_2 \dots \xrightarrow{R_n} M_n = N$  is **standard** iff for all  $i, j$  ( $0 < i < j \leq n$ ), redex  $R_j$  is not a residual of redex  $R'_j$  to the left of  $R_i$  in  $M_{i-1}$ .

# Standard reduction

# Standardization

- **Theorem [standardization] (Curry)** Any reduction can be standardized.

- The **normal reduction** (each step contracts the leftmost-outermost redex) is a standard reduction.
- **Corollary [normalization]** If  $M$  has a normal form, the normal reduction reaches the normal form.

# Standardization lemma

- **Notation:** write  $R <_{\ell} S$  if redex  $R$  is to the left of redex  $S$ .
- **Lemma 1** Let  $R, S$  be redexes in  $M$  such that  $R <_{\ell} S$ . Let  $M \xrightarrow{S} N$ . Then  $R/S = \{R'\}$ . Furthermore, if  $T' <_{\ell} R'$ , then  $\exists T, T <_{\ell} R, T' \in T/S$ .  
[one cannot create a redex through another more-to-the-left]

- **Proof of standardization thm:** [Klop] application of the finite developments theorem and previous lemma.

# Standardization axioms

- 3 axioms are sufficient to get lemma 1
- **Axiom 1 [linearity]**  $S \not\leq_{\ell} R$  implies  $\exists!R', R' \in R/S$
- **Axiom 2 [context-freeness]**  $S \not\leq_{\ell} R$  and  $R' \in R/S$  and  $T' \in T/S$  implies  
 $T \mathfrak{R} R$  iff  $T' \mathfrak{R} R'$  where  $\mathfrak{R}$  is  $<_{\ell}$  or  $>_{\ell}$
- **Axiom 3 [left barrier creation]**  $R <_{\ell} S$  and  $\nexists T', T \in T'/S$  implies  $R <_{\ell} T$

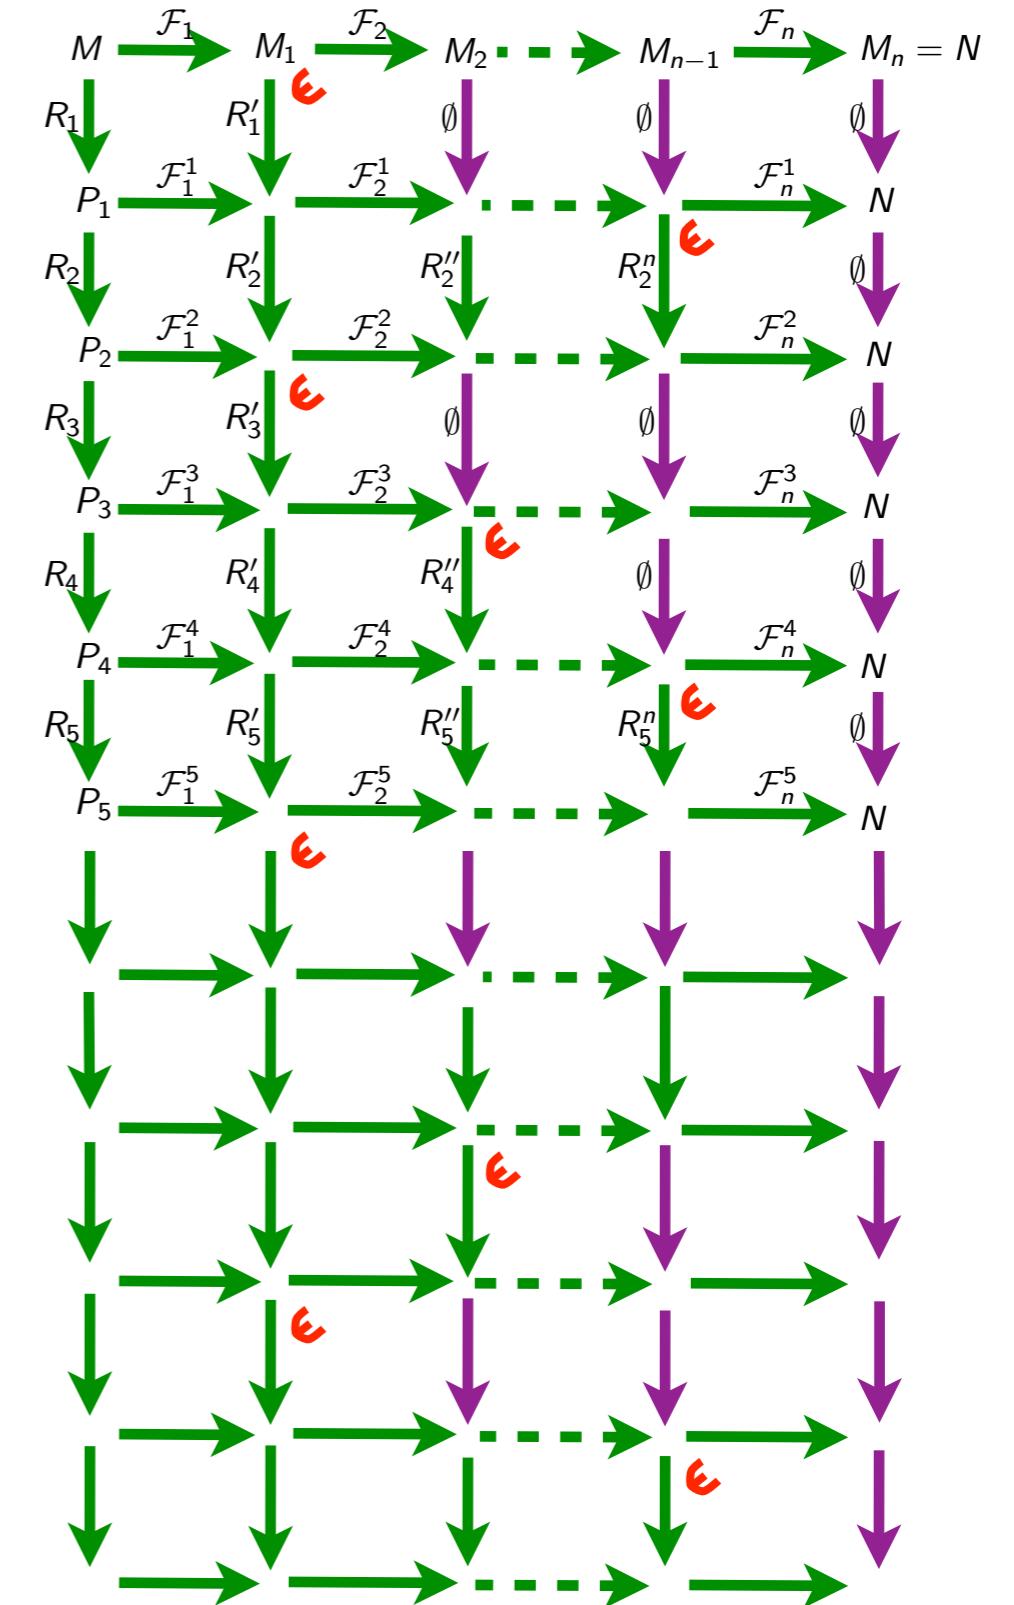

# Standardization proof

- **Proof:**

Each square is an application of the lemma of parallel moves. Let  $\rho_i$  be the horizontal reductions and  $\sigma_j$  the vertical ones. Each horizontal step is a parallel step, vertical steps are either elementary or empty.

We start with reduction  $\rho_0$  from  $M$  to  $N$ . Let  $R_1$  be the leftmost redex in  $M$  with residual contracted in  $\rho_0$ . By lemma 1, it has a single residual  $R'_1$  in  $M_1, M_2, \dots$  until it belongs to some  $\mathcal{F}_k$ . Here  $R'_1 \in \mathcal{F}_2$ . There are no more residuals of  $R_1$  in  $M_{k+1}, M_{k+2}, \dots$ .

Let  $R_2$  be leftmost redex in  $P_1$  with residual contracted in  $\rho_1$ . Here the unique residual is contracted at step  $n$ . Again with  $R_3$  leftmost with residual contracted in  $\rho_2$ . Etc.

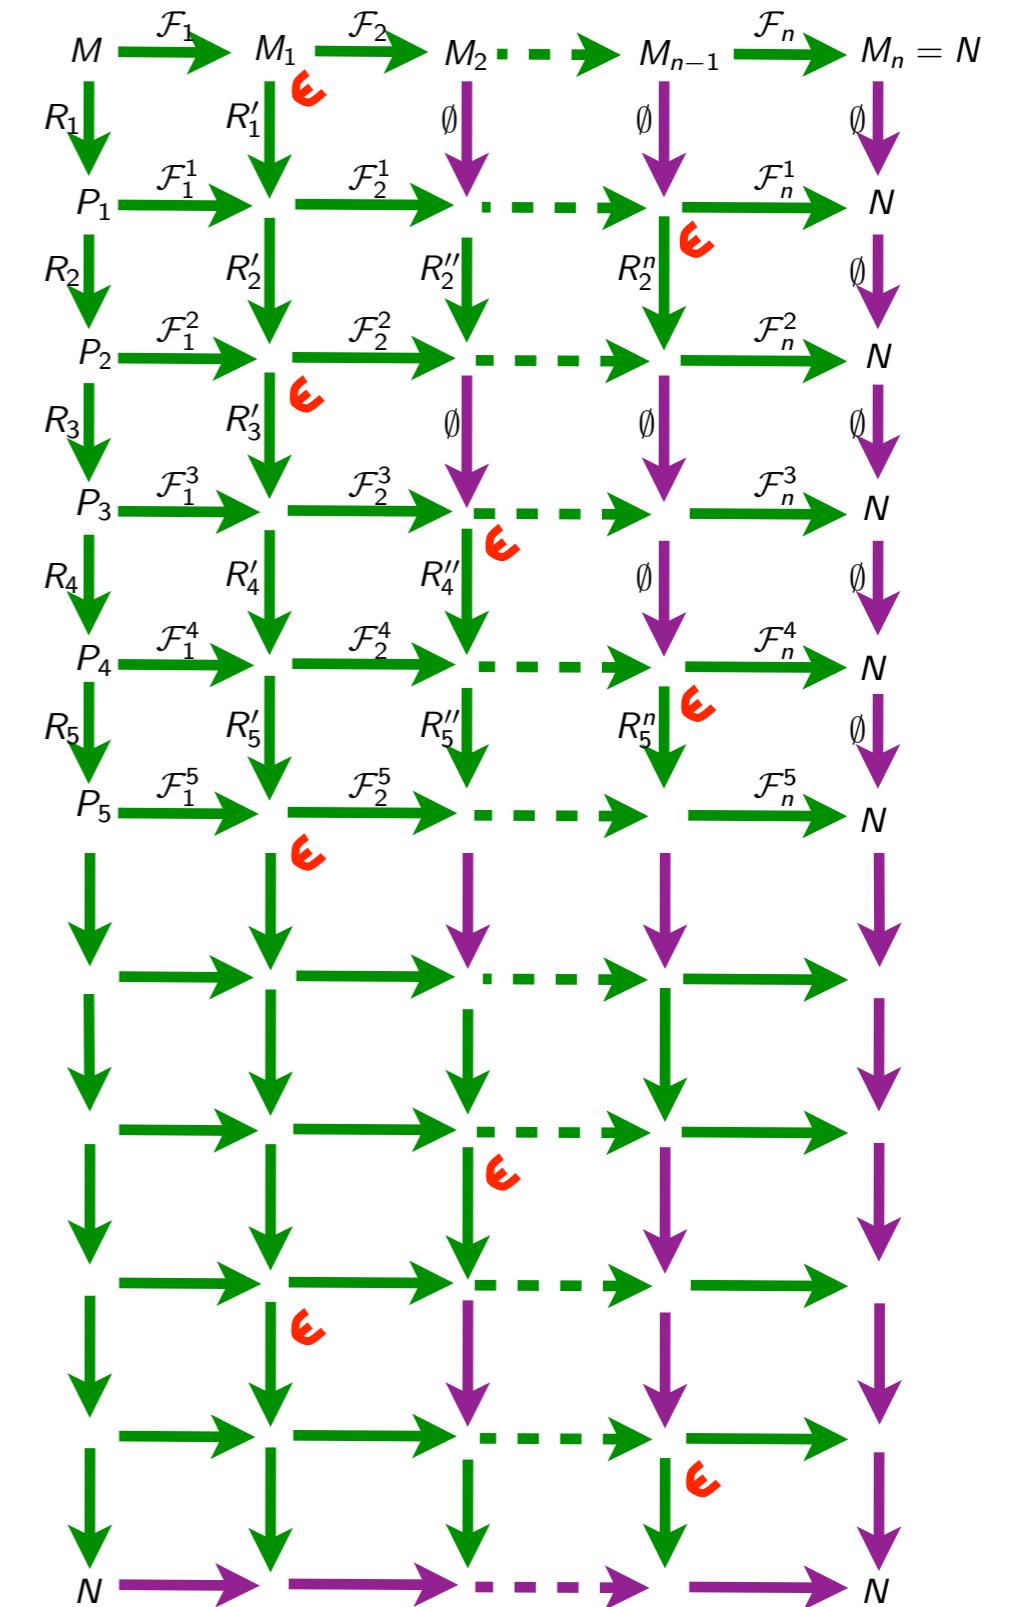

# Standardization proof

- Proof (cont'd):

Now reduction  $\sigma_0$  starting from  $M$  cannot be infinite and stops for some  $p$ . If not, there is a rightmost column  $\sigma_k$  with infinitely non-empty steps. After a while, this reduction is a reduction relative to a set  $\mathcal{F}_i^j$ , which cannot be infinite by the Finite Development theorem.

Then  $\rho_p$  is an empty reduction and therefore the final term of  $\sigma_0$  is  $N$ .

# Standardization proof

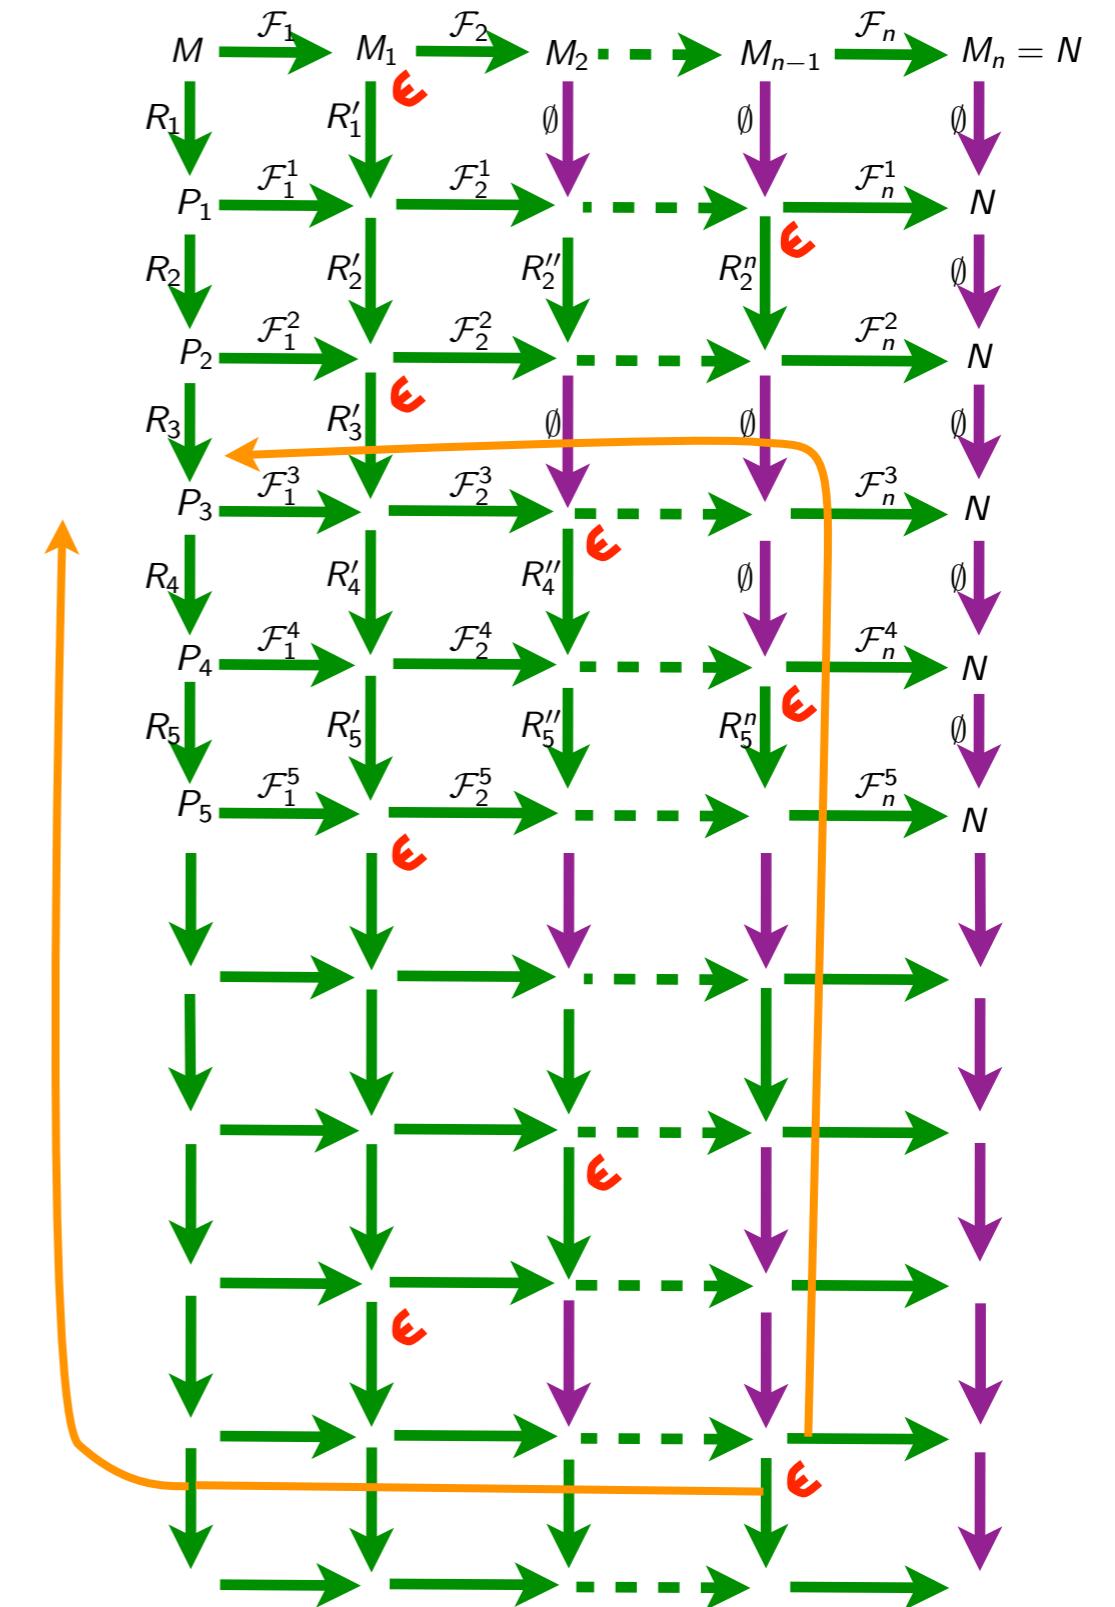

- Proof (cont'd):

We claim  $\sigma_0$  is a standard reduction. Suppose  $R_k$  ( $k > i$ ) is residual of  $S_i$  to the left of  $R_i$  in  $P_{i-1}$ .

By construction  $R_k$  has residual  $S_k^j$  along  $\rho_{i-1}$  contracted at some  $j$  step. So  $S_k^j$  is residual of  $S_i$ .

By the cube lemma, it is also residual of some  $S_i^j$  along  $\sigma_{j-1}$ . Therefore there is  $S_i^j$  in  $\mathcal{F}_i^j$  residual of  $S_i$  leftmore or outer than  $R_i$ .

Contradiction.

# Redex creation

CENTRE DE RECHERCHE  
COMMUN

INRIA  
MICROSOFT RESEARCH

# Created redexes

- A redex is **created by reduction**  $\rho$  if it is not a residual by  $\rho$  of a redex in initial term. Thus  $R$  is created by  $\rho$  when  $\rho : M \xrightarrow{*} N$  and  $\nexists S, R \in S/\rho$

$$(\lambda x.xa)I \xrightarrow{*} \underline{Ia}$$

$$(\lambda xy.xy)ab \xrightarrow{*} (\lambda y.\underline{ay})b$$

$$IIa \xrightarrow{*} \underline{Ia}$$

$$\Delta\Delta \xrightarrow{*} \underline{\Delta\Delta}$$

- By Finite Developments thm, a reduction can be infinite iff it does not stop creating new redexes.

$$\Delta\Delta \xrightarrow{*} \underline{\Delta\Delta} \xrightarrow{*} \underline{\Delta\Delta} \xrightarrow{*} \underline{\Delta\Delta} \xrightarrow{*} \dots$$

- If the length of creation is bounded, there is also a generalized finite developments theorem.

# Created redexes in typed calculus

- only 2 cases for creation of redexes in a reduction step

$$\frac{(\lambda x. \dots xN \dots)(\lambda y.M) \rightarrow \dots (\lambda y.M)N' \dots}{\sigma \rightarrow \tau \quad \sigma \quad \sigma}$$

creates

$$\frac{(\lambda x. \lambda y.M)NP \rightarrow (\lambda y.M')P}{\sigma \rightarrow \tau \quad \tau}$$

creates

- length of creation is bounded by size of types of initial term

# Exercices

- Show that:

**1-**  $M \rightarrow_{\eta} N \rightarrow P$  implies  $M \rightarrow Q \xrightarrow{\star}_{\eta} P$  for some  $Q$

**2-**  $M \xrightarrow{\star}_{\eta} N \rightarrow P$  implies  $M \xrightarrow{\star} Q \xrightarrow{\star}_{\eta} P$  for some  $Q$

**3-**  $M \xrightarrow{\star}_{\beta,\eta} N$  implies  $M \xrightarrow{\star} P \xrightarrow{\star}_{\eta} N$  for some  $P$

**4-**  $M \rightarrow N$  and  $M \rightarrow_{\eta} P$  implies  $N \xrightarrow{\star}_{\eta} Q$  and  $P \xrightarrow{1} Q$  for some  $Q$

**5-**  $M \xrightarrow{\star}_{\eta} N$  and  $M \xrightarrow{\star}_{\eta} P$  implies  $N \xrightarrow{\star}_{\eta} Q$  and  $P \xrightarrow{\star}_{\eta} Q$  for some  $Q$

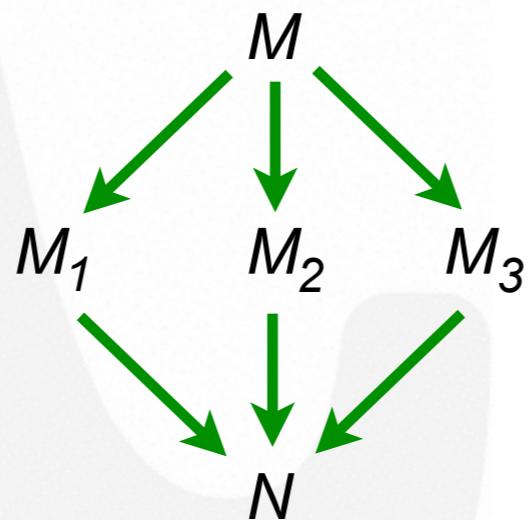

**6-**  $M \xrightarrow{\star}_{\beta,\eta} N$  and  $M \xrightarrow{\star}_{\beta,\eta} P$  implies  $N \xrightarrow{\star}_{\beta,\eta} Q$  and  $P \xrightarrow{\star}_{\beta,\eta} Q$  for some  $Q$

Therefore  $\xrightarrow{\star}_{\beta,\eta}$  is confluent.

- Show same property for  $\beta$ -reduction and  $\eta$ -expansion ( $\rightarrow \cup \xleftarrow{\eta}$ ) $^*$

# Exercices

- 7-** Show there is no  $M$  such that  $M \xrightarrow{*} Kac$  and  $M \xrightarrow{*} Kbc$  where  $K = \lambda x.\lambda y.x$ .
- 8-** Find  $M$  such that  $M \xrightarrow{*} Kab$  and  $M \xrightarrow{*} Kac$ .
- 9-** (difficult) Show that  $\xleftarrow{*}$  is not confluent.
- 10-** Show that  $\Delta\Delta(II)$  has no normal form when  $I = \lambda x.x$  and  $\Delta = \lambda x.xx$ .
- 11-** Show that  $\Delta\Delta M_1 M_2 \cdots M_n$  has no normal form for any  $M_1, M_2, \dots, M_n$  ( $n \geq 0$ ).
- 12-** Show there is no  $M$  whose reduction graph is exactly following:

- 13-** Show that rightmost-outermost reduction may miss normal forms.
